

DSA Notes Sample - Sushanth Contribution

Stack follows LIFO principle. Push and Pop operations run in $O(1)$ time.

A stack is used in function call management, undo operations, and expression evaluation.

Queue follows FIFO principle. Enqueue and Dequeue operations run in $O(1)$ time.

Binary search runs in $O(\log n)$ time on a sorted array using divide and conquer.

A graph consists of vertices and edges, traversed using DFS or BFS algorithms.

Linked lists allow $O(1)$ insertion at the head but $O(n)$ traversal to find an element.

Merge sort runs in $O(n \log n)$ time using a divide and conquer strategy.

Binary trees have a root, internal nodes, and leaves; traversal can be inorder, preorder, or postorder.

Stack follows LIFO principle. Push and Pop operations run in $O(1)$ time.
